

This chapter focuses on using window functions towards analysis and make use of keywords such as PARTITION BY and ORDER BY.

BASIC WINDOW FUNCTION STRUCTURE:

```
SELECT {columns},  
  
{window_func} OVER (PARTITION BY {partition_key} ORDER BY {order_key})  
  
FROM table_name;  
  
e.g.  
  
SELECT customer_id, title, first_name,last_name, gender,  
  
COUNT (*) OVER (PARTITION BY gender) AS total_customers  
  
FROM customers  
  
ORDER BY customer_id  
;
```

The screenshot shows a SQL IDE interface. The top panel displays a SQL query: `SELECT customer_id, title, first_name, last_name, gender, COUNT (*) OVER (PARTITION BY gender) AS total_customers FROM customers ORDER BY customer_id ;`. Below the query editor, there are tabs for 'Data Output', 'Messages', and 'Notifications'. The 'Data Output' tab is active, showing a table with 7 rows and 8 columns. The columns are: an index, `customer_id` (bigint), `title` (text), `first_name` (text), `last_name` (text), `gender` (text), and `total_customers` (bigint). The data rows show customer information and their total count, partitioned by gender.

	customer_id bigint	title text	first_name text	last_name text	gender text	total_customers bigint
